How do I set up a loaner instrument?

Make sure yourÂ instrument is connected to com1 and turned on. IfÂ youÂ just gotÂ your instrument back from repair, make sureÂ you have switched the loaner instrument out for the returned instrument before proceeding.

SelectÂ the option "Change Active Instrument" from the Paintmaker or Paint installation CD:

1. Retrieve the instrument calibration diskette and the most current version of the software, Datacolor Paint or Paintmaker.
2. Exit all applications and place the CD in the CDRomÂ drive
3. Upon the autostart, select Change Active Instrument
4. From the select Instrument type menu that will appear next, select the properÂ instrument. Â
5. You willÂ be prompted to insert the calibration diskette or CD.

If the original problem was bad matches, run the drift test by selecting Spectro Diags (password for True Value customers is kevin) from the Options Menu. You must calibrate the spectro from the diags window.Â After calibration, run the drift test using the white tile. If the test passes, the instrument is setup correctly and using the proper calibration data and also passing the diagnostic test.Â You should monitor matches and call back if problems persist. If the test fails, send to HWsupport@datacolor.com
