

The dyelot generation does not match with the combined process. Why?

If the dyelot generation type is **“From combined process or recipe”** or **“Always from recipe”** and there is a recipe generation valid for production, then ITMProcess uses the recipe generation and not the combined process to generate the dyelot.

If you want to use the combined process:

- **Remove the generated recipe**
- **Or set the generation type to: “Only from combined process”**

^

Locate **Dyelot generation type**: open the record combined process | tab Settings | field Dyelot generation type

^

Locate **Recipe generation valid for production**: open the record recipe | tab Generated recipe | Generation row with Lab not checked
